## AMD2 Dipole (PROSCAN, PIF/Gantry 3)

AMD2 dipole (AEF from CERN) measured from the beam exit end

conductor $7 \times 7$, D 4 mm
176 turns/coil, $\mathrm{I}_{\text {MAX }}=220 \mathrm{~A}$

MEASUREMENT DATE:
20-28. Oct. 2014

MEASUREMENT ARM:
brass cylinder interface $\varnothing 40 \mathrm{~mm}$
aluminum pipe $\varnothing 28 \mathrm{~mm}, 1 \mathrm{~m}$
carbon pipes $\varnothing 10 / 8 / 6 \mathrm{~mm}, 1.5 \mathrm{~m}$

MEASURING SPEED:
$4.5 \mathrm{~mm} / \mathrm{sec}$ (X-axis)
$49 \mathrm{~mm} / \mathrm{sec}(Z-a x i s)$

INTEGRATION TIME:
20 msec

DVM-1 (1 V RANGE):
Hall probe sbv 175 ( 150 mA )
powered in series with the other 2

DVM-2 (1, 10 V RANGE):
200 V / 500 A (MSG-1), 5 A/s

AIR CONDITIONING:
ON ( $\mathrm{T}_{\text {SET }}=24.5^{\circ}$ )

OPERATORS:
Roland Deckardt
Vjeran Vranković (I20-I22)

DATA DIRECTORY:
afs: group/magnet/meas/amd2

## Magnet alignment and positioning

The AMD2 magnet was placed on the standard concrete blocks (H500mm). Since the magnet gap varies by almost 1 mm , the magnet's mid-plane and not the pole surface was used for levelling.

In the measurements coordinate system the magnet axis is the Z-axis, vertical axis is the Y -axis (see the sketch). The coordinate system origin is in the middle of the gap.

The positioning was done by eye.
The probe was levelled with the help of a spirit level built into the measuring arm.

## Excitation curve

Before measurements the magnet was cycled from 220 A to -220 A. The measurements were performed for the currents from 0 A to 220 A and then back to 0 A. Only half of the curve was measured because the power supply used (MSG-1) is unipolar.

The fields were measured at 23 currents on the line $X=Y=0, Z= \pm 1000 \mathrm{~mm}$.
